

## Chapter Six: Arrays and Vectors

Slides by Evan Gallagher

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Chapter Goals

- To become familiar with using arrays and vectors to collect values
- To learn about common algorithms for processing arrays and vectors
- To write functions that receive and return arrays and vectors
- To be able to use two-dimensional arrays

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Using Arrays and Vectors

Mail, mail and more mail – how to manage it?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Using Vectors

- When you need to work with a large number of values – all together, the vector construct is your best choice.
- By using a *vector* you
  - can conveniently manage collections of data
  - do not worry about the details of how they are stored
  - do not worry about how many are in the vector
    - a vector automatically grows to any desired size

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Using Arrays

- Arrays are a lower-level construct
- The *array* is
  - less convenient
  - but sometimes required
    - for efficiency
    - for compatibility with older software

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Using Arrays and Vectors

All the mail these days seems alike **junk!**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays and Vectors

In both vectors and arrays,  
the stored data is of  
the **same type**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays and Vectors

Think of a sequence of data:

32 54 67.5 29 35 80 115 44.5 100 65

(all of the same type, of course)  
(storable as doubles)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays and Vectors

32 54 67.5 29 35 80 115 44.5 100 65

Which is the largest in this set?

(You must look at every single value to decide.)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays and Vectors

32 54 67.5 29 35 80 115 44.5 100 65

So you would create a variable for each,  
of course!

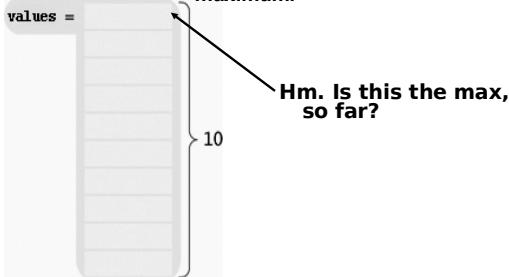

`int n1, n2, n3, n4, n5, n6, n7, n8, n9, n10;`

*Then what ???*

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

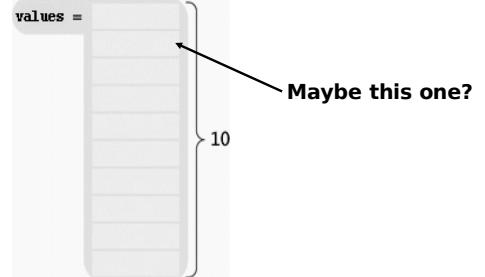

## Using Arrays and Vectors

You can easily visit each element in an array or in a vector,  
checking and updating a variable holding the current  
maximum.

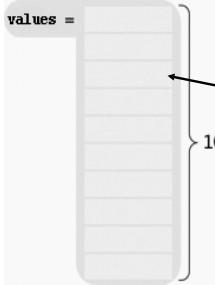

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays and Vectors

## Using Arrays and Vectors

That would have been impossible with ten separate variables!

```
int n1, n2, n3, n4, n5, n6, n7, n8, n9, n10;
```

And what if there needed to be another double in the set?

ARGH!

C++ for Everyone by Cay Horstmann

## Defining Arrays with Initialization

When you define an array, you can specify the initial values:

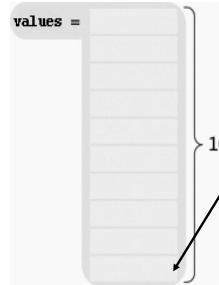

```
double values[] = { 32, 54, 67.5, 29, 35, 80, 115, 44.5, 100, 65 };
```

A diagram showing a vertical array of 10 elements. The array is represented by a light gray rectangle divided into 10 horizontal slots. To the left of the array, the variable name 'values =' is written. A curly brace to the right of the array indicates its size: '10'. The individual elements are labeled with their values: 32.0, 54.0, 67.5, 29.0, 35.0, 80.0, 115.0, 44.5, 100.0, and 65.0. An arrow points from the text 'Or this one?' to the top slot of the array. Another arrow points from the text 'Will this never end!' to the bottom slot of the array.

## Defining Arrays

An “array of double”  
Ten elements of **double type** can be stored under one name as an array.  
double values[10];  
type of each element  
quantity of elements – the “size” of the array, must be a constant

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Array Syntax

### Defining an Array

Element type Name Size  
double values[5] = { 32, 54, 67.5, 29, 34.5 };  
Size must be a constant.  
Ok to omit size if initial values are given.  
Use brackets to access an element.  
values[1] = 0;  
Optional list of initial values  
The index must be  $\geq 0$  and  $<$  the size of the array.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Array Syntax

Table 1 Defining Arrays

<code>int numbers[10];</code>	An array of ten integers.
<code>const int SIZE = 10;</code> <code>int numbers[SIZE];</code>	It is a good idea to use a named constant for the size.
<code>⚠️ int size = 10;</code> <code>int numbers[size];</code>	<b>Caution:</b> In standard C++, the size must be a constant. This array definition will not work with all compilers.
<code>int squares[5] = { 0, 1, 4, 9, 16 };</code>	An array of five integers, with initial values.
<code>int squares[] = { 0, 1, 4, 9, 16 };</code>	You can omit the array size if you supply initial values. The size is set to the number of initial values.
<code>int squares[5] = { 0, 1, 4 };</code>	If you supply fewer initial values than the size, the remaining values are set to 0. This array contains 0, 1, 4, 0, 0.
<code>string names[3];</code>	An array of three strings.

C++ for Everyone by Cay Horstmann

## Accessing an Array Element

An array element can be used like any variable.

To access an array element, you use the notation:

**values[i]**

where *i* is the *index*.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

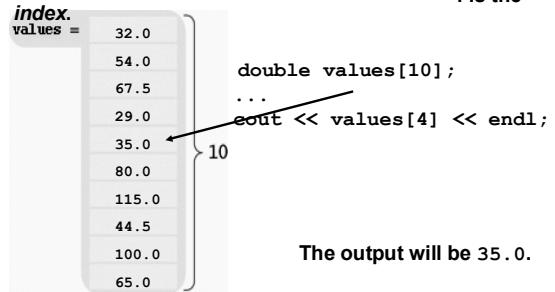

Put the junk mail in there  
in mailboxes[356]

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

To access the element at index 4 using this notation:

**values[4]**

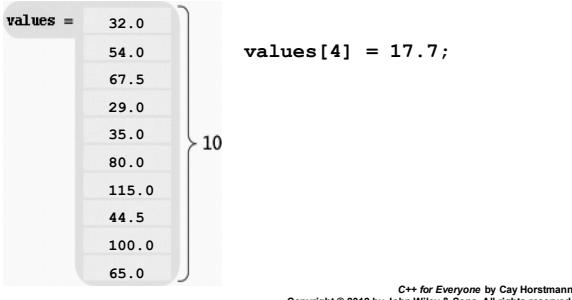

The output will be 35.0.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

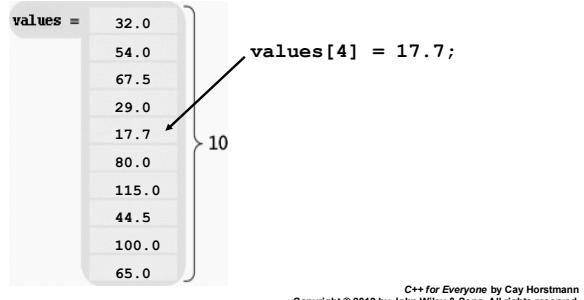

The same notation can be used to change the element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

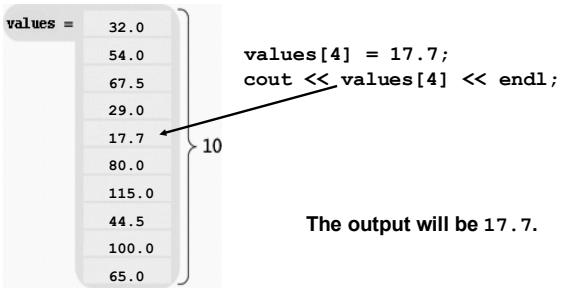

The same notation can be used to change the element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

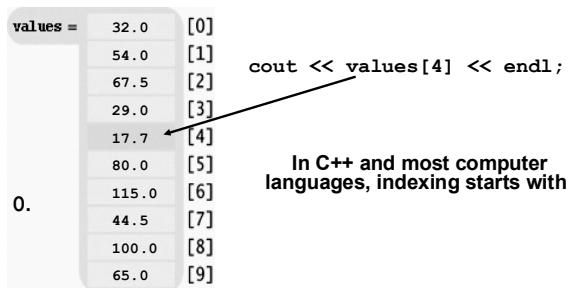

The same notation can be used to change the element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

You might have thought those last two slides were wrong:  
values[4] is getting the data from the “fifth” element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing an Array Element

That is, the legal elements for the `values` array are:

`values[0]`, the **first** element  
`values[1]`, the second element  
`values[2]`, the third element  
`values[3]`, the fourth element  
`values[4]`, the fifth element  
...  
`values[9]`, the tenth and **last legal** element  
recall: `double values[10];`

The index must be  $\geq 0$  and  $\leq 9$ .  
0, 1, 2, 3, 4, 5, 6, 7, 8, 9 is 10 numbers.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays

Suppose an array can hold 10 elements:

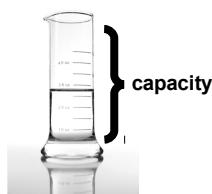

Does it always?  
Just look at that beaker.  
Guess not!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

How many elements, at most, can an array hold?

We call this quantity the **capacity**.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

For example, we may decide for a particular problem that there are usually ten or 11 values, but never more than 100.

We would set the capacity with a const:

```
const int CAPACITY = 100;  
double values[CAPACITY];
```

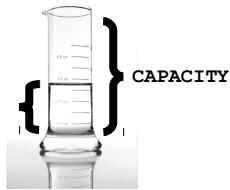

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays

Arrays will usually hold less than CAPACITY elements.

We call this kind of array a *partially filled array*:

only partially filled to here

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Companion Variable for Size

But how many actual elements are there in a partially filled array?

We will use a *companion variable* to hold that amount:

```
const int CAPACITY = 100;
double values[CAPACITY];
```

```
int current_size = 0; // array is empty
```

Suppose we add four elements to the array?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Companion Variable for Size

```
const int CAPACITY = 100;
double values[CAPACITY];
```

```
current_size = 4; // array now holds 4
```

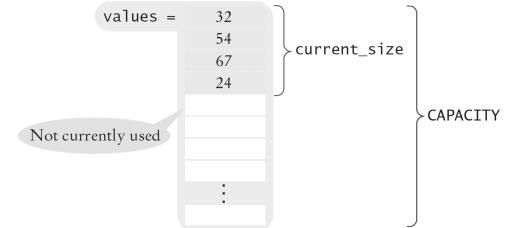

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Companion Variable for Size

```
const int CAPACITY = 100;
double values[CAPACITY];
```

```
current_size = 4; // array now holds 4
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

The following loop fills an array with user input.  
Each time the size of the array changes we update this variable:

```
const int CAPACITY = 100;
double values[CAPACITY];

int size = 0;
double input;
while (cin >> input)
{
    if (size < CAPACITY)
    {
        values[size] = x;
        size++;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

The following loop fills an array with user input.  
Each time the size of the array changes we update this variable:

```
const int CAPACITY = 100;
double values[CAPACITY];

int size = 0;
double input;
while (cin >> input)
{
    if (size < CAPACITY)
    {
        values[size] = x;
        size++;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

When the loop ends, the companion variable `size` has the number of elements in the array.

```
const int CAPACITY = 100;
double values[CAPACITY];

int size = 0;
double input;
while (cin >> input)
{
    if (size < CAPACITY)
    {
        values[size] = x;
        size++;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Partially-Filled Arrays – Capacity

How would you print the elements in a partially filled array?

By using the `current_size` companion variable.

```
for (int i = 0; i < current_size; i++)
{
    cout << values[i] << endl;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A `for` loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)
{
    cout << values[i] << endl;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A `for` loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)
{
    cout << values[i] << endl;
}
```

When `i` is 0,

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A `for` loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)
{
    cout << values[0] << endl;
}
```

When `i` is 0, `values[i]` is `values[0]`, the first element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A `for` loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)
{
    cout << values[i] << endl;
}
```

When `i` is 0, `values[i]` is `values[0]`, the first element.

When `i` is 1,

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A **for** loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)  
{  
    cout << values[i] << endl;  
}
```

When **i** is 0, **values[i]** is **values[0]**, the first element.

When **i** is 1, **values[i]** is **values[1]**, the second element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A **for** loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)  
{  
    cout << values[2] << endl;  
}
```

When **i** is 0, **values[i]** is **values[0]**, the first element.

When **i** is 1, **values[i]** is **values[1]**, the second element.

When **i** is 2, **values[i]** is **values[2]**, the third element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Arrays – Visiting All Elements

To visit all elements of an array, use a variable for the index.

A **for** loop's variable is best:

```
for (int i = 0; i < CAPACITY; i++)  
{  
    cout << values[9] << endl;  
}
```

When **i** is 0, **values[i]** is **values[0]**, the first element.

When **i** is 1, **values[i]** is **values[1]**, the second element.

When **i** is 2, **values[i]** is **values[2]**, the third element.

...

When **i** is 9, **values[i]** is **values[9]**.

## Illegally Accessing an Array Element – *Bounds Error*

A *bounds* error occurs when you access an element outside the legal set of indices:

```
cout << values[10];
```

Doing this can corrupt data or cause your program to terminate.

DANGER!! !

DANGER!! !

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Use Arrays for Sequences of Related Values

Recall that the type of every element must be the same. That implies that the “meaning” of each stored value is the same.

```
int scores[NUMBER_OF_SCORES];
```

Clearly the meaning of each element is a score.

(even if it is a bad score, it's still a score)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Use Arrays for Sequences of Related Values

But an array could be used improperly:

```
double personal_data[3];
personal_data[0] = age;
personal_data[1] = bank_account;
personal_data[2] = shoe_size;
```

Clearly these doubles do *not* have the same meaning!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Use Arrays for Sequences of Related Values

But worse:

```
personal_data[ ] = new_shoe_size;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Use Arrays for Sequences of Related Values

But worse:

```
personal_data[?] = new_shoe_size;
```

Oh dear!

Which position was I using for the shoe size?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Use Arrays for Sequences of Related Values

Arrays should be used when the meaning of each element is the same.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Array and Vector Algorithms

There are many typical things that are done with sequences of values.

There are many common algorithms for processing values stored in both arrays and vectors.

(We will get to vectors a bit later but the algorithms are the same)

Did someone mention algorithms?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Filling

This loop fills an array with zeros:

```
for (int i = 0; i < size of values; i++)
{
    values[i] = 0;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Filling

Here, we fill the array with squares (0, 1, 4, 9, 16, ...).

Note that the element with index 0 will contain  $0^2$ , the element with index 1 will contain  $1^2$ , and so on.

```
for (int i = 0; i < size of squares; i++)
{
    squares[i] = i * i;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Copying

Consider these two arrays:

```
int squares[5] = { 0, 1, 4, 9, 16 };
int lucky_numbers[5];
```

How can we copy the values from squares to lucky\_numbers?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Copying

Let's try what seems right and easy...

```
squares = lucky_numbers;
```

...and wrong!

You cannot assign arrays!

You will have to do your own work, son.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Copying

```
int squares[5] = { 0, 1, 4, 9, 16 };
int lucky_numbers[5];
```

```
for (int i = 0; i < 5; i++)
{
    squares[i] = i * i;
}
```

when i is 0

squares =	0	[0]	lucky_numbers =	[0]
	1	[1]		[1]
	4	[2]		[2]
	9	[3]		[3]
	16	[4]		[4]

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Common Algorithms – Copying

```
int squares[5] = { 0, 1, 4, 9, 16 };
int lucky_numbers[5];
```

```
for (int i = 0; i < 5; i++)
{
    squares[i] = i * i;
}
```

when *i* is 0

squares =	0 [0]	lucky_numbers =	0 [0]
	1 [1]		1 [1]
	4 [2]		4 [2]
	9 [3]		9 [3]

## Common Algorithms – Sum and Average Value

You have already seen an algorithm for computing the sum of a set of data. The algorithm is the same as for copying data, just stored in an array.

Same algorithm  
- different situation.  
Aren't algorithms great!

```
double total = 0;
for (int i = 0; i < size of values;
{
    total = total + values[i];
}
```

The average is just arithmetic:

```
double average = total / size of values;
```

C++ for Everyone by Cay Horstmann

## Common Algorithms – Who Is the Tallest?

me?

Who's the tallest in the line?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Who Is the Tallest?

If everyone's height is stored in an array, determining the largest value (who's the tallest person's height?) is just another algorithm...

Come along, children,  
let's use an algorithm  
to see who is tallest.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum and Minimum

To compute the largest value in a vector, keep a variable that stores the largest element that you have encountered, and update it when you find a larger one.

```
double largest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] > largest)
    {
        largest = values[i];
    }
}
```

C++ for Everyone by Cay Horstmann

## Common Algorithms – Who Is the Shortest?

me?

Who's the shortest in the line?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Element Separators

When you display the elements of a vector, you usually want to separate them, often with commas or vertical lines, like this:

1 | 4 | 9 | 16 | 25

Note that there is one fewer separator than there are numbers.

To print five elements,  
you need four separator

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum and Minimum

To compute the largest value in a vector, keep a variable that stores the largest element that you have encountered, and update it when you find a larger one.

```
double largest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] > largest)
    {
        largest = values[i];
    }
}
```

Note that the loop starts at 1 because we initialize largest with data[0].

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum and Minimum

For the minimum, we just reverse the comparison.

```
double smallest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < smallest)
    {
        smallest = values[i];
    }
}
```

These algorithms require that the array contain at least one element.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Element Separators

Print the separator before each element except the initial one (with index 0):

1 | 4 | 9 | 16 | 25

```
for (int i = 0; i < SIZE OF values; i++)
{
    if (i > 0)
    {
        cout << " | ";
    }
    cout << values[i];
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Linear Search

Find the position of a certain value, say 100, in an array:

```
int pos = 0;
bool found = false;
while (pos < size_of values && !found)
{
    if (values[pos] == 100) // looking for 100
    {
        found = true;
    }
    else
    {
        pos++;
    }
}
```

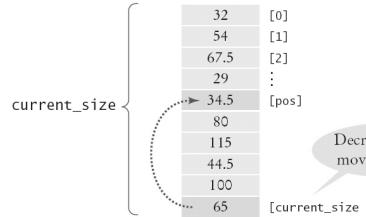

**Don't get these tests in the wrong order!**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Removing an Element, Unordered

Suppose you want to remove the element at index *i*. If the elements in the vector are not in any particular order, that task is easy to accomplish.

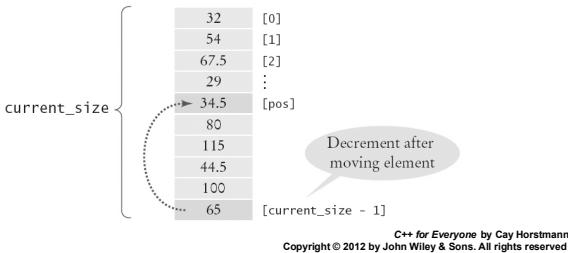

Simply overwrite the element to be removed with the *last* element of the vector, then shrink the size of the vector by removing the value that was copied.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Removing an Element, Unordered

```
values[pos] = values[current_size - 1];
current_size--;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

The situation is more complex if the order of the elements matters.

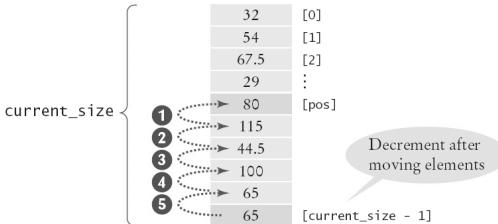

Then you must move all elements following the element to be removed “down” (to a lower index), and then shrink the size of the vector by removing the last element.

```
for (int i = pos + 1; i < current_size; i++)
{
    values[i - 1] = values[i];
}
current_size--;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Removing an Element, Ordered

```
for (int i = pos + 1; i < current_size; i++)
{
    values[i - 1] = values[i];
}
current_size--;
```

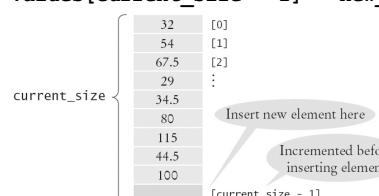

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element Unordered

If the order of the elements does not matter, in a partially filled array (which is the only kind you can insert into), you can simply insert a new element at the end.

```
if (current_size < CAPACITY)
{
    current_size++;
    values[current_size - 1] = new_element;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

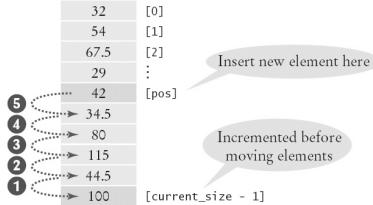

Incremented before inserting element

## Common Algorithms – Inserting an Element Ordered

If the order of the elements does matter, it is a bit harder.

To insert an element at position *i*, all elements from that location to the end of the vector must be moved “up”.

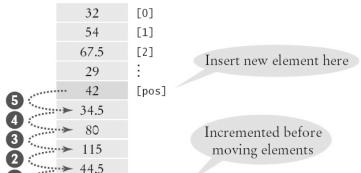

After that insert the new element at the now vacant position

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element Ordered

```
if (current_size < CAPACITY)
{
    current_size++;
    for (int i = current_size - 1; i > pos; i--)
    {
        values[i] = values[i - 1];
    }
    values[pos] = new_element;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Swapping Elements

Suppose we need to swap the values at positions *i* and *j* in the array.  
Will this work?

```
values[i] = values[j];
values[j] = values[i];
```

Look closely!

In the first line you lost – forever! – the value at *i*, replacing it with the value at *j*.

Then what?

Put' *j*'s value back in *j* in the second line?

**ARGHHH!**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element Ordered

First, you must make the array one larger by incrementing `current_size`.

Next, move all elements above the insertion location to a higher index.

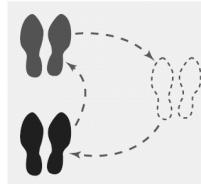

Finally, insert the new element in the place you made for it.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Swapping Elements

Swapping two elements in an array is an important part of sorting an array.

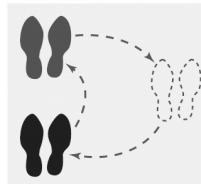

To do a swap of two things, you need *three* things!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Swapping Elements

You need a *third* dance partner!

## Common Algorithms – Reading Input

If the know how many input values the user will supply, you can store them directly into the array:

```
double values[NUMBER_OF_INPUTS];  
for (i = 0; i < NUMBER_OF_INPUTS; i++)  
{  
    cin >> values[i];  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Reading Input

When there will be an arbitrary number of inputs,  
things get more complicated.  
But not hopeless.

Add values to the end of the array until all inputs have been  
made.

Again, the companion variable will have the number of  
inputs.

```
double values[CAPACITY];
int current_size = 0;
double input;
while (cin >> input)
{
    if (current_size < CAPACITY)
    {
        values[current_size] = input;
        current_size++;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms

Now back to where we started:

How do we determine the largest in a set of data?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum

ch06/largest.cpp

```
#include <iostream>

using namespace std;

int main()
{
    const int CAPACITY = 1000;
    double values[CAPACITY];
    int current_size = 0;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Reading Input

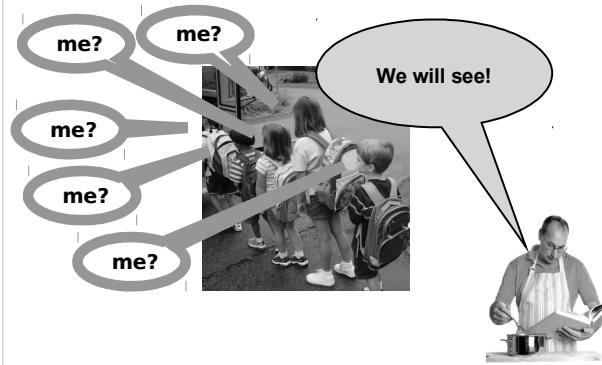

Unfortunately it's even more complicated:

Once the array is full, we allow the user to keep entering!

Because we can't change the size  
of an array after it has been created,  
we'll just have to give up for now.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Who Is the Tallest?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum

ch06/largest.cpp

```
cout << "Please enter values, Q to quit:" << endl;
double input;
while (cin >> input)
{
    if (current_size < CAPACITY)
    {
        values[current_size] = input;
        current_size++;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum

ch06/largest.cpp

```
double largest = values[0];
for (int i = 1; i < current_size; i++)
{
    if (values[i] > largest)
    {
        largest = values[i];
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

Getting data into order is something that is often needed.

An alphabetical listing.

A list of grades in descending order.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

In C++, you call the `sort` function to do your sorting for you.

But the syntax is new to you:

Recall our `values` array with the companion variable `current_size`.

```
sort(values, values + current_size);
```

To sort the elements into ascending numerical order, you call the `sort` algorithm:

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Maximum

ch06/largest.cpp

```
for (int i = 0; i < current_size; i++)
{
    cout << values[i];
    if (values[i] == largest)
    {
        cout << " == largest value";
    }
    cout << endl;
}

return 0;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

Let's let the shortest people go first.

We'll need to `sort` ourselves.

Let's use an algorithm I found in this C++ library.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

Yes, we said *call* the `sort` algorithm.

C++ has a library named `algorithm` that contains...  
algorithms,  
as functions.

```
sort(values, values + current_size);
```

What else?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

You will need to write:

```
#include <algorithm>

in order to use the sort function.

sort(values, values + current_size);
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Recall that when we work with arrays  
we use a companion variable.

The same concept applies when  
using arrays as parameters:

You must pass the size to the function  
so it will know how many elements to work with.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

No, that is not a box!

```
double sum(double data[], int size)
{
    double total = 0;
    for (int i = 0; i < size; i++)
    {
        total = total + data[i];
    }
    return total;
}
```

It is an empty pair of square  
brackets.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Sorting with the C++ Library

Notice also that you must tell the `sort` function  
where to begin: `values`,  
(which is the start of the array)  
and where to end: `values + current_size`,  
(which is one after the last element in the array).

```
sort values, values + current_size);
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Here is the `sum` function with an array parameter:  
Notice that to pass one array, it takes two parameters.

```
double sum(double data[], int size)
{
    double total = 0;
    for (int i = 0; i < size; i++)
    {
        total = total + data[i];
    }
    return total;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

You use an empty pair of square brackets  
after the parameter variable's name to  
indicate you are passing an array.

```
double sum(double data[], int size)
```

Hear Ye!  
Know Ye!  
This be an  
array!

And THIS  
BE ITS  
SIZE

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Ne'er ERR!

Fail ye not to

```
double sum(double data[], int size)
```

Proffer both - THUSLY!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

When you call the function,  
supply both the name of the array and the size:

```
double NUMBER_OF_SCORES = 10;  
double scores[NUMBER_OF_SCORES]  
= { 32, 54, 67.5, 29, 34.5, 80, 115, 44.5, 100, 65 };  
double total_score = sum(scores, NUMBER_OF_SCORES);
```

You can also pass a smaller size to the function:

```
double partial_score = sum(scores, 5);
```

This will sum over only the first five doubles in the array.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

When you pass an array into a function,  
the contents of the array can *always* be changed:

```
void multiply(double values[], int size, double factor)  
{  
    for (int i = 0; i < size; i++)  
    {  
        values[i] = values[i] * factor;  
    }  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

And writing an ampersand is *always* an error:

```
void multiply1(double& values[], int size, double factor)  
{  
    for (int i = 0; i < size; i++)  
    {  
        values[i] = values[i] * factor;  
    }  
}  
void multiply2(double values[]&, int size, double factor)  
{  
    for (int i = 0; i < size; i++)  
    {  
        values[i] = values[i] * factor;  
    }  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

And writing an ampersand is *always* an error:

```
void multiply1(double values[], int size, double factor)  
{  
    for (int i = 0; i < size; i++)  
    {  
        values[i] = values[i] * factor;  
    }  
}  
void multiply2(double values[]&, int size, double factor)  
{  
    for (int i = 0; i < size; i++)  
    {  
        values[i] = values[i] * factor;  
    }  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

You can pass an array into a function

but

you cannot return an array.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

If you cannot return an array, how can the caller get the data?

```
??? squares(int n)
{
    int result[]
    for (int i = 0; i < n; i++)
    {
        result[i] = i * i;
    }
    return result; // ERROR
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

A function can change the size of an array.  
It should let the caller know of any change  
by returning the new size.

```
int read_inputs(double inputs[], int capacity)
{
    int current_size = 0;
    double input;
    while (cin >> input)
    {
        if (current_size < capacity)
        {
            inputs[current_size] = input;
            current_size++;
        }
    }
    return current_size;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Or it can let the caller know by using a  
reference parameter:

```
void append_inputs(double inputs[], int capacity,
                   int& current_size)
{
    double input;
    while (cin >> input)
    {
        if (current_size < capacity)
        {
            inputs[current_size] = input;
            current_size++;
        }
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

The caller must provide an array to be used:

```
void squares(int n, int result[])
{
    for (int i = 0; i < n; i++)
    {
        result[i] = i * i;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Here is a call to the function:

```
const int MAXIMUM_NUMBER_OF_VALUES = 1000;
double values[MAXIMUM_NUMBER_OF_VALUES];
int current_size =
    read_inputs(values, MAXIMUM_NUMBER_OF_VALUES);
```

After the call,  
the `current_size` variable  
specifies how many were added.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

Here is a call to the reference parameter  
version of `append_inputs`:

```
append_inputs(values, MAXIMUM_NUMBER_OF_VALUES,
              current_size);
```

As before, after the call,  
the `current_size` variable  
specifies how many are in the array.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

The following program uses the preceding functions to read values from standard input, double them, and print the result.

- The `read_inputs` function fills an array with the input values. It returns the number of elements that were read.
- The `multiply` function modifies the contents of the array that it receives, demonstrating that arrays can be changed inside the function to which they are passed.
- The `print` function does not modify the contents of the array that it receives.

C++ for Everyone by Cay Horstmann

## Arrays as Parameters in Functions

```
double input;
cin >> input;
if (cin.fail())
{
    more = false;
}
else if (current_size < capacity)
{
    inputs[current_size] = input;
    current_size++;
}
return current_size;
```

ch06/functions.cpp

## Arrays as Parameters in Functions

ch06/functions.cpp

```
/** Prints the elements of a vector, separated by commas.
@param values a partially filled array
@param size the number of elements in values */
void print(double values[], int size)
{
    for (int i = 0; i < size; i++)
    {
        if (i > 0) { cout << ", ";}
        cout << values[i];
    }
    cout << endl;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

ch06/functions.cpp

```
/** Reads a sequence of floating-point numbers.
@param inputs an array containing the numbers
@param capacity the capacity of that array
@return the number of inputs stored in the array */
int read_inputs(double inputs[], int capacity)
{
    int current_size = 0;
    cout << "Please enter values, Q to quit:" << endl;
    bool more = true;
    while (more)
    {
```

C++ for Everyone by Cay Horstmann

## Arrays as Parameters in Functions

ch06/functions.cpp

```
/** Multiplies all elements of an array by a factor.
@param values a partially filled array
@param size the number of elements in values
@param factor the value with which each element is multiplied */
void multiply(double values[], int size,
              double factor)
{
    for (int i = 0; i < size; i++)
    {
        values[i] = values[i] * factor;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays as Parameters in Functions

ch06/functions.cpp

```
int main()
{
    const int CAPACITY = 1000;
    double values[CAPACITY];
    int size = read_inputs(values, CAPACITY);
    multiply(values, size, 2);
    print(values, size);

    return 0;
}
```

## Problem Solving: Adapting Algorithms

Recall that you saw quite a few  
(too many?)  
algorithms for working with arrays.

Suppose you need to solve a problem that  
does not exactly fit any of those?

What to do?

No, “give up” is not an option!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

You can try to use algorithms you already know  
to produce a new algorithm that will solve this problem.  
(Then you'll have yet another algorithm – even more!)

Cooking up a new  
algorithm!

Bon Appétit!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Consider this problem:

Compute the final quiz score from a set of quiz scores,

but be nice:  
drop the lowest score.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Hmm, what do I know how to do?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Calculate the sum:

```
double total = 0;
for (int i = 0; i < SIZE OF values; i++)
{
    total = total + values[i];
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Find the minimum:

```
double smallest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < smallest)
    {
        smallest = values[i];
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Remove an element:

```
values[pos] = values[current_size - 1];
current_size--;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

Aha indeed!

1. Find the minimum
2. Remove it from the array
3. Calculate the sum  
(will be without the lowest score)
4. Calculate the final score

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

```
values[pos] = values[current_size - 1];
current_size--;
```

This algorithm removes by knowing  
the position  
of the element to remove...  
...but...

```
double smallest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < smallest)
    {
        smallest = values[i];
    }
}
```

That's not the **position** of the smallest –  
it IS the smallest.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

Aha indeed!

1. Find the minimum
2. Find the **position** of the minimum  
→ the one I just searched for!!!
3. Remove it from the array
4. Calculate the sum  
(will be without the lowest score)
5. Calculate the final score

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

## Problem Solving: Adapting Algorithms

I wonder if I can **adapt** the algorithm  
that finds the minimum so that it finds  
the position of the minimum?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

I'll start with this:

```
double smallest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < smallest)
    {
        smallest = values[i];
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

There it is!

```
int smallest_position = 0;
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < values[smallest_position])
    {
        smallest_position = i;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Discovering Algorithms by Manipulating Physical Objects

What if you come across a problem for which you cannot find an algorithm you know and you cannot figure out how to adapt any algorithms?

What to do?

No, again, “give up” is not an option!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Problem Solving: Adapting Algorithms

What is it about the minimum value and where the minimum value is?

```
double smallest = values[0];
for (int i = 1; i < SIZE OF values; i++)
{
    if (values[i] < smallest)
    {
        smallest = values[i];
    }
}
```

C++ for Everyone by Cay Horstmann

## Two-Dimensional Arrays

It often happens that you want to store collections  
of values that have a two-dimensional layout.

Such data sets commonly occur in  
financial and scientific applications.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Arrays

An arrangement consisting of *tabular data*:  
*rows and columns* of values

is called:  
a *two-dimensional array*, or a *matrix*.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Arrays

Consider this data from the 2010  
Olympic skating competitions:

	Gold	Silver	Bronze
Canada	1	0	1
China	1	1	0
Germany	0	0	1
Korea	1	0	0
Japan	0	1	1
Russia	0	1	1
United States	1	1	0

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Arrays

Consider this data from the 2006 Olympic skating competitions:

	Gold	Silver	Bronze
Canada	1	0	1
China	1	1	0
Germany	0	0	1
Korea	1	0	0
Japan	0	1	1
Russia	0	1	1
United States	1	1	0

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays

C++ uses an array with two subscripts to store a two-dimensional array.

```
const int COUNTRIES = 7;
const int MEDALS = 3;
int counts[COUNTRIES][MEDALS];
```

An array with 7 rows and 3 columns is suitable for storing our medal count data.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays – Unchangeable Size

Just as with one-dimensional arrays, you *cannot* change the size of a two-dimensional array once it has been defined.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays – Initializing

But you can initialize a 2-D array:

```
int counts[COUNTRIES][MEDALS] =
{
    { 1, 0, 1 },
    { 1, 1, 0 },
    { 0, 0, 1 },
    { 1, 0, 0 },
    { 0, 1, 1 },
    { 0, 1, 1 },
    { 1, 1, 0 }
};
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays

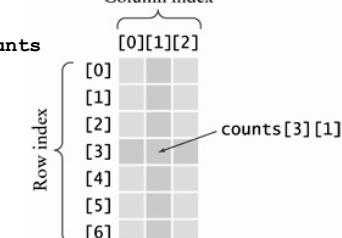

### SYNTAX 6.3 Two-Dimensional Array Definition

```
Element type   Rows   Columns
           /     /       \
           int data[4][4] = {           Optional list of initial values
             Name
               /   /   /
               { 16, 3, 2, 13 },
               { 5, 10, 11, 8 },
               { 9, 6, 7, 12 },
               { 4, 15, 14, 1 },
             };
           }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays – Accessing Elements

The Olympic array looks like this:

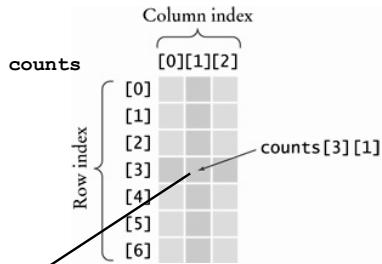

Access to the second element in the fourth row is:

counts[3][1]

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays – Accessing Elements

```
// set value to what is currently  
// stored in the array at [3][1]  
int value = counts[3][1];
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Arrays

I'd like to  
see the  
results  
now,  
please.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

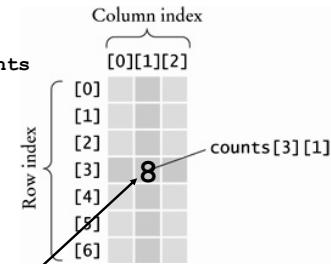

## Computing Row and Column Totals

A common task is to compute row or column totals.

In our example,  
the row totals give us the total number  
of medals won by a particular country.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Two-Dimensional Arrays – Accessing Elements

```
// set that position in the array to 8  
counts[3][1] = 8;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Arrays

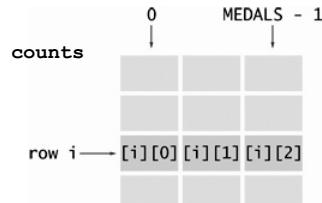

Gladly:

```
for (int i = 0; i < COUNTRIES; i++)  
{  
    // Process the ith row  
    for (int j = 0; j < MEDALS; j++)  
    {  
        // Process the jth column in the ith row  
        cout << setw(8) << counts[i][j];  
    }  
    // Start a new line at the end of the row  
    cout << endl;  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Computing Row and Column Totals

We must be careful to get the right indices.

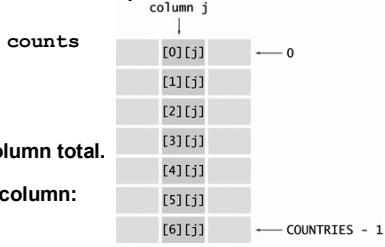

For each row  $i$ , we must use the column indices:  
 $0, 1, \dots, (MEDALS - 1)$

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Computing Row and Column Totals

How many of each kind of medal (*metal!*) was won by the set of these particular countries?

That would be a column total.

Let  $j$  be the silver column:

```
int total = 0;
for (int i = 0; i < COUNTRIES; i++)
{
    total = total + counts[i][j];
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

This function computes the total of a given row.

```
const int COLUMNS = 3;
int row_total(int table[][] [COLUMNS], int row)
{
    int total = 0;
    for (int j = 0; j < COLUMNS; j++)
    {
        total = total + table[row][j];
    }
    return total;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

That function works for only arrays of 3 columns.

If you need to process an array with a different number of columns, like 4,  
you would have to write a *different function* that has 4 as the parameter.

Hm.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

When passing a two-dimensional array to a function, you must specify the number of columns as a *constant* when you write the parameter type.

table[] [COLUMNS]

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

int row\_total(int table[] [COLUMNS], int row)

In this function, to find the element `table[row][j]` the compiler generates code by computing the offset

$(row * COLUMNS) + j$

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

What's the reason behind this?

Although the array appears to be two-dimensional, the elements are still stored as a linear sequence.

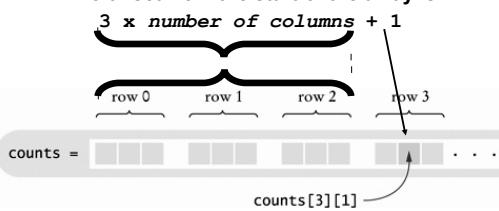

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

counts is stored as a sequence of rows, each 3 long.

So where is counts[3][1]?

The offset from the start of the array is

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

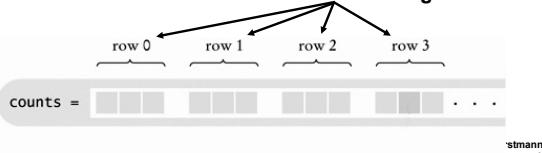

## Two-Dimensional Array Parameters

```
int row_total(int table[][][COLUMNNS], int row)
```

table[] looks like a normal 1D array.

It is!

Each element is COLUMNNS ints long.

Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters – Common Error

Leaving out the columns value is a very common error.

```
int row_total(int table[][], int row)  
...
```

The compiler doesn't know how "long" each row is!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

```
int row_total(int table[][][COLUMNNS], int row)
```

table[] looks like a normal 1D array.

Notice the empty square brackets.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

## Two-Dimensional Array Parameters

The row\_total function did not need to know the number of rows of the array.

If the number of rows is required, pass it in:

```
int column_total(int table[][][COLUMNNS], int rows, int col)  
{  
    int total = 0;  
    for (int i = 0; i < rows; i++)  
    {  
        total = total + table[i][col];  
    }  
    return total;  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters – Common Error

Putting a value for the rows is not an error.

```
int row_total(int table[17][COLUMNNS], int row)  
...
```

The compiler just ignores whatever you place there.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters – Not an Error

Putting a value for the rows is not an error.

```
int row_total(int table[17][COLUMNS], int row)
...
```

The compiler just ignores whatever you place there.

```
int row_total(int table[][], int row)
...
```

Never  
mind

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

Here is the complete program for medal and column counts.

ch06/medals.cpp

```
#include <iostream>
#include <iomanip>
#include <string>

using namespace std;

const int COLUMNS = 3;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

ch06/medals.cpp

```
int main()
{
    const int COUNTRIES = 7;
    const int MEDALS = 3;

    string countries[] =
    {
        "Canada",
        "China",
        "Germany",
        "Korea",
        "Japan",
        "Russia",
        "United States"
    };
```

C++ for Everyone by Cay Horstmann

## Two-Dimensional Array Parameters

ch06/medals.cpp

```
/** 
 * Computes the total of a row in a table.
 * @param table a table with 3 columns
 * @param row the row that needs to be totaled
 * @return the sum of all elements in the given row
 */
double row_total(int table[][], int row)
{
    int total = 0;
    for (int j = 0; j < COLUMNS; j++)
    {
        total = total + table[row][j];
    }
    return total;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

ch06/medals.cpp

```
cout << "    Country   Gold   Silver   Bronze   Total"
     << endl;

// Print countries, counts, and row totals
for (int i = 0; i < COUNTRIES; i++)
{
    cout << setw(15) << countries[i];
    // Process the ith row
    for (int j = 0; j < MEDALS; j++)
    {
        cout << setw(8) << counts[i][j];
    }
    int total = row_total(counts, i);
    cout << setw(8) << total << endl;
}
return 0;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Two-Dimensional Array Parameters

ch06/medals.cpp

```
int counts[COUNTRIES][MEDALS] =
{
    { 1, 0, 1 },
    { 1, 1, 0 },
    { 0, 0, 1 },
    { 1, 0, 0 },
    { 0, 1, 1 },
    { 0, 1, 1 },
    { 1, 1, 0 }
};
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays – One Drawback

The size of an array *cannot* be changed after it is created.

You have to get the size right – *before* you define an array.

The compiler has to know the size to build it.  
and a function must be told about the number  
elements and possibly the capacity.

It cannot hold more than its initial capacity.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors

A vector

is not fixed in size when it is created

and

it does not have the limitation  
of needing an auxiliary variable

AND

you can keep putting things into it  
forever!

Well, conceptually forever.  
(There's only so much RAM.)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Vectors

By default, a vector is empty when created.

```
vector<double> data; // data is empty
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays – One Drawback

Wouldn't it be good if there were  
something that never filled up?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Vectors

When you define a vector, you  
must specify the type of the elements.

```
vector<double> data;
```

Note that the element type is enclosed in angle brackets.

**data can contain only doubles**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Vectors

You can specify the initial size.

You still must specify the type of the elements.

For example, here is a definition of a  
vector of doubles whose initial size is 10.

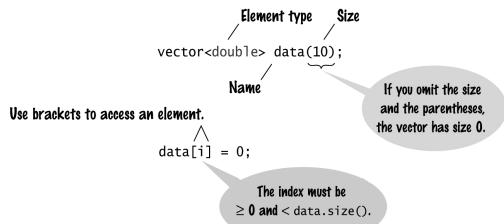

```
vector<double> data(10);
```

This is very close to the **data array** we used earlier.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Vectors

### SYNTAX 6.2 Defining a Vector

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Defining Vectors

### Table 2 Defining Vectors

<code>vector&lt;int&gt; numbers(10);</code>	A vector of ten integers.
<code>vector&lt;string&gt; names(3);</code>	A vector of three strings.
<code>vector&lt;double&gt; values;</code>	A vector of size 0.
<code>vector&lt;double&gt; values();</code>	Error: Does not define a vector.
<code>vector&lt;int&gt; numbers; for (int i = 1; i &lt;= 10; i++) {     numbers.push_back(i); }</code>	A vector of ten integers, filled with 1, 2, 3, ..., 10.
<code>vector&lt;int&gt; numbers(10); for (int i = 0; i &lt; numbers.size(); i++) {     numbers[i] = i + 1; }</code>	Another way of defining a vector of ten integers and filling it with 1, 2, 3, ..., 10.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing Elements in Vectors

You access the elements in a vector the same way as in an array, using an index.

```
vector<double> values(10);  
//display the forth element  
cout << values[3] << endl;
```

HOWEVER...

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Accessing Elements in Vectors

It is an error to access a element that is not **empty** in a vector.

```
vector<double> values;  
//display the forth element  
cout << values[3] << endl;
```

ERROR!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back

So how do you put values into a vector?

You push 'em—

—in the  
back!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back and pop\_back

The method `push_back` is used to put a value into a vector:

```
values.push_back( 32 );
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **push\_back and pop\_back**

```
values.push_back( 32 );
```

adds the value 32.0 to the vector named `values`.

The vector increases its size by 1.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **pop\_back**

And how do you take them out?

You pop 'em!

—from the  
back!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **push\_back and pop\_back**

The method `pop_back` removes  
the last value placed into the vector with `push_back`.

```
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **push\_back and pop\_back**

```
values.pop_back();
```

removes the last value from the vector named `values`

and the vector decreases its size by 1.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **push\_back Adds an Element**

```
vector<double> values;

values.push_back(32);
values.push_back(54);
values.push_back(67.5);
values.push_back(29);
values.push_back(65);
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## **push\_back Adds an Element**

```
vector<double> values;
values.push_back(32);
values.push_back(54);
values.push_back(67.5);
values.push_back(29);
values.push_back(65);
values.pop_back();
```

values is an empty  
vector.  
Its size is 0.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values } 0

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0 } 1

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

32 is placed into the vector.  
Its size is now 1.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0 } 1

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0 } 2

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

54 is placed into the vector.  
It now contains the elements  
32.0 and 54.0,  
and its size is 2.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0 } 2

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0  
67.5 } 3

```
vector<double> values;  
  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

67.5 is placed into the vector.  
It now contains the elements  
32.0, 54.0 and 67.5,  
and its size is 3.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

```
values = 32.0 } 3  
vector<double> values;  
54.0  
67.5  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

```
values = 32.0 } 4  
vector<double> values;  
54.0  
67.5  
29.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Removing the Last Element with pop\_back

```
values = 32.0 } 5  
vector<double> values;  
54.0  
67.5  
29.0  
65.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

```
values = 32.0 } 4  
vector<double> values;  
54.0  
67.5  
29.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();  
29 is placed into the vector.  
It now contains the elements  
32.0, 54.0, 67.5 and 29.0,  
and its size is 4.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

```
values = 32.0 } 4  
vector<double> values;  
54.0  
67.5  
29.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

### push\_back Adds an Element

```
values = 32.0 } 5  
vector<double> values;  
54.0  
67.5  
29.0  
65.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();  
65 is placed into the vector.  
It now contains the elements  
32.0, 54.0, 67.5, 29.0 and  
65.0,  
and its size is 5.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Removing the Last Element with pop\_back

```
values = 32.0 } 5  
vector<double> values;  
54.0  
67.5  
29.0  
65.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();
```

### Removing the Last Element with pop\_back

```
values = 32.0 } 4  
vector<double> values;  
54.0  
67.5  
29.0  
values.push_back(32);  
values.push_back(54);  
values.push_back(67.5);  
values.push_back(29);  
values.push_back(65);  
values.pop_back();  
65 is no longer in the vector.  
It now contains only the  
elements  
32.0, 54.0, 67.5 and 29.0,  
and its size is 4.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back and pop\_back

You can use `push_back` to put user input into a vector:

```
double input;
while (cin >> input)
{
    values.push_back(input);
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back Adds an Element

```
vector<double> values;

double input;
while (cin >> input
{
    values.push_back(input);
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back Adds an Element

values } 0

```
vector<double> values;

double input;
while (cin >> input
{
    values.push_back(input);
}
```

We are starting again with an empty vector.  
Its size is 0.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back Adds an Element

values } 0

```
vector<double> values;

double input;
while (cin >> input) --- The user types 32
{
    values.push_back(input);
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back Adds an Element

values } 0

```
vector<double> values;

double input;
while (cin >> input)
{
    values.push_back(input);
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## push\_back Adds an Element

values = 32.0 } 1

```
vector<double> values;

double input;
while (cin >> input)
{
    values.push_back(input);
}
```

32 is placed into the vector.  
Its size is now 1.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0 } 1

```
vector<double> values;  
  
double input;  
while (cin >> input) --- The user types 54  
{  
    values.push_back(input);  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0 } 2

```
vector<double> values;  
  
double input;  
while (cin >> input)  
{  
    values.push_back(input);  
}  
  
54 is placed into the  
vector.  
Its size is now 2.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

= 32.0  
54.0 } 2

```
vector<double> values;  
  
double input;  
while (cin >> input) . . . . . types 67.5  
{  
    values.push_back(input);  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0  
67.5 } 3

```
vector<double> values;  
  
double input;  
while (cin >> input)  
{  
    values.push_back(input);  
}  
  
67.4 is placed into the  
vector.  
Its size is now 3.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0  
67.5 } 3

```
vector<double> values;  
  
double input;  
while (cin >> input) --- The user types 29  
{  
    values.push_back(input);  
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### push\_back Adds an Element

values = 32.0  
54.0  
67.5  
29.0 } 4

```
vector<double> values;  
  
double input;  
while (cin >> input)  
{  
    values.push_back(input);  
}  
  
29 is placed into the  
vector.  
Its size is now 4.
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Vectors - size\_of

How do you visit every element in an vector?

Recall arrays.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Vectors - size\_of

With arrays, to display every element, it would be:

?

```
for (int i = 0; i < 10; i++)
{
    cout << values[i] << endl;
}
```

But with vectors, we don't know about that 10!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Vectors - size\_of

Vectors have the `size` member function which returns the current size of a vector.

The vector always knows how many are in it and you can always ask it to give you that quantity by calling the `size` method:

```
for (int i = 0; i < values.size(); i++)
{
    cout << values[i] << endl;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Using Vectors - size\_of

Recall all those array algorithms you learned?

```
for (int i = 0; i < size of array; i++)
{
    ... // use array [i]
```

To make them work with vectors, you still use a `for` statement,

but instead of looping until `size of array`,  
you loop until `vector.size()`:

```
for (int i = 0; i < vector.size(); i++)
{
    ... // use vector [i]
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors As Parameters In Functions

You know that

**functions**

are the way to go for code reuse  
and solving sub-problems  
and many other good things...

**so...**

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors As Parameters In Functions

How can you pass vectors as parameters?

You use vectors as function parameters in exactly the same way as any parameters.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors Parameters – Without Changing the Values

For example, the following function computes the sum of a vector of floating-point numbers:

```
double sum(vector<double> values)
{
    double total = 0;
    for (int i = 0; i < values.size(); i++)
    {
        total = total + values[i];
    }
    return total;
}
```

This function *visits* the vector elements, but it does *not change* them.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors Parameters – Changing the Values

Sometimes the function *should change* the values stored in the vector:

```
void multiply(vector<double>& values, double factor)
{
    for (int i = 0; i < values.size(); i++)
    {
        values[i] = values[i] * factor;
    }
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors Parameters – Changing the Values

Sometimes the function *should change* the values stored in the vector:

```
void multiply(vector<double>& values, double factor)
{
    for (int i = 0; i < values.size(); i++)
    {
        values[i] = values[i] * factor;
    }
}
```

Note that the vector is passed *by reference*, just like any other parameter you want to change.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors Returned from Functions

Sometimes the function should *return* a vector.

Vectors are no different from any other values in this regard.

Simply build up the result in the function and return it:

```
vector<int> squares(int n)
{
    vector<int> result;
    for (int i = 0; i < n; i++)
    {
        result.push_back(i * i);
    }
    return result;
}
```

The function returns the squares from  $0^2$  up to  $(n - 1)^2$  by returning a vector.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Vectors and Arrays as Parameters in Functions

Vectors as parameters are easy.

Arrays are not *quite* so easy.

(vectors... vectors...)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Copying, Arrays Cannot Be Assigned

Suppose you have two arrays

```
int squares[5] = { 0, 1, 4, 9, 16 };
int lucky_numbers[5];
```

The following assignment is an error:

```
lucky_numbers = squares; // Error
```

You must use a loop to copy all elements:

```
for (int i = 0; i < 5; i++)
{
    lucky_numbers[i] = squares[i];
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Copying, Vectors Can Be Assigned

Vectors do not suffer from this limitation.

Consider this example:

```
vector<int> squares;
for (int i = 0; i < 5; i++)
{
    squares.push_back(i * i);
}
vector<int> lucky_numbers;
// Initially empty
lucky_numbers = squares;
// Now lucky_numbers contains
// the same elements as squares
```

## Common Algorithms – Copying, Vectors Can Be Assigned

You can assign a vector to another vector.

Of course they have to hold the same type to do this.

```
vector<int> squares;
for (int i = 0; i < 5; i++)
{
    squares.push_back(i * i);
}
vector<int> lucky_numbers;
// Initially empty
lucky_numbers = squares;
// Now lucky_numbers contains
// the same elements as squares
```

## Common Algorithms – Finding Matches

Suppose we want all the values in a vector that are greater than a certain value, say 100, in a vector.

Store them in another vector:

```
vector<double> matches;
for (int i = 0; i < values.size(); i++)
{
    if (values[i] > 100)
    {
        matches.push_back(values[i]);
    }
}
```

## Common Algorithms – Removing an Element, Unordered

If you know the position of an element you want to remove from a vector in which the elements are not in any order, as you did in an array,

overwrite the element at that position with the last element in the vector,

then be sure to remove the last element, which also makes the vector smaller.

```
int last_pos = values.size() - 1;
// Take the position of the last element
values[pos] = values[last_pos];
// Replace element at pos with last element
values.pop_back();
// Delete last element
```

## Common Algorithms – Removing an Element, Ordered

If you know the position of an element you want to remove from a vector in which the elements are in some order, as you did in an array,

move all the elements after that position,

then remove the last element to reduce the size.

```
for (int i = pos + 1; i < values.size(); i++)
{
    values[i - 1] = values[i];
}
data.pop_back();
```

C++ for Everyone by Cay Horstmann

## Common Algorithms – Inserting an Element, Unordered

When you need to insert an element into a vector whose elements are not in any order...

...oh, this is going to be so easy:

```
values.push_back(new_element);
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element, Ordered

However when the elements in a vector are in some order, it's a bit more complicated, just like it was in the array version.

Of course you must know the position, say `pos`, where you will insert the new element.

As in the array version you need to move all the elements "up".

```
for (int i = last_pos; i > pos; i--)  
{    values[i] = values[i - 1];}
```

**WAIT!!!**

C++ for Everyone by Cay Horstmann

## Common Algorithms – Inserting an Element, Ordered

Somehow you need to make the vector one bigger

before you do the moving.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element, Ordered

Yes, it will be in the vector twice,

but why care?

```
int last_pos = values.size() - 1;  
values.push_back(values[last_pos]);
```

You will overwrite it by doing the moving.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element, Ordered

# You can't do that!

In a vector you cannot assign to the position after the last one!

You cannot assign to any position bigger than

```
values() - 1.
```

OH DEAR!!!

## Common Algorithms – Inserting an Element, Ordered

## Common Algorithms – Inserting an Element, Ordered

Be clever.

If you `push_back` the last element:

```
int last_pos = values.size() - 1;  
values.push_back(values[last_pos]);
```

*...but, but...*

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element, Ordered

And, more importantly,  
the vector is now one larger after the `push_back`.  
Congratulations, it's to safe go ahead and start moving.

```
int last_pos = values.size() - 1;  
values.push_back(values[last_pos]);  
for (int i = last_pos; i > pos; i--)  
{    values[i] = values[i - 1];}  
values[pos] = new_element;
```

And don't forget to insert the new element.  
That's what you've been trying to do all along!

C++ for Everyone by Cay Horstmann

## Common Algorithms – Inserting an Element, Ordered

Ah.

```
int last_pos = values.size() - 1;
values.push_back(values[last_pos]);
for (int i = last_pos; i > pos; i--)
{
    values[i] = values[i - 1];
}
values[pos] = new_element;
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Algorithms – Inserting an Element, Ordered

But don't be too clever,  
if the position to insert the new element  
is after the last element...

...oh, this is going to be so easy,  
don't do any moving, just put it there:

```
values.push_back(new_element);
```

Inserting into an ordered vector means  
inserting into the *middle* of the vector!

## Sorting with the C++ Library

Recall that you call the `sort` function  
to do your sorting for you.

This can be used on vectors also.

The syntax for vectors is even more unusual than arrays:

```
sort(values.begin(), values.end());
```

Go ahead and use it as you like.  
But don't forget to `#include <algorithm>`

## Arrays or Vectors? That Is the Question

Should you use arrays or vectors?

(you know you want to say vectors...)

C++ for Everyone by Cay Horstmann

## Arrays or Vectors? That Is the Question

For most programming tasks,  
vectors are easier to use than arrays.

(say vectors, say vectors...)

C++ for Everyone by Cay Horstmann

## Arrays or Vectors? That Is the Question

Vectors can grow and shrink.

(grow, shrink - think;  
vectors...)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Arrays or Vectors? That Is the Question

Even if a vector always stays the same size,  
it is convenient that a vector remembers its size.

No chance of missing auxiliaries.

Vectors are smarter than arrays!

(size matters and vectors know their own -  
vectors...)

C++ for Everyone by Cay Horstmann

## Arrays or Vectors? That Is the Question

For a beginner, the sole advantage of  
an array is the initialization syntax.

(syntax, shmyntax – it's easy too with vectors...)

C++ for Everyone by Cay Horstmann

## Arrays or Vectors? That Is the Question

Advanced programmers sometimes prefer arrays  
because they are a bit more efficient.

Moreover, you need to know how to use  
arrays if you work with older programs

(only a bit? and older? why not be current by using  
vectors...)

C++ for Everyone by Cay Horstmann

## Prefer Vectors over Arrays

So:

Prefer Vectors over Arrays

(it's so nice when the moral of the story is: vectors!!!)

C++ for Everyone by Cay Horstmann

## CHAPTER SUMMARY

### Use arrays for collecting values.

- Use an array to collect a sequence of values of the same type.
- Individual elements in an array *values* are accessed by an integer index *i*, using the notation *values[i]*.
- An array element can be used like any variable.
- An array index must be at least zero and less than the size of the array.
- A bounds error, which occurs if you supply an invalid array index, can corrupt data or cause your program to terminate.
- With a partially filled array, keep a companion variable for the current size.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## CHAPTER SUMMARY

### Be able to use common array algorithms.

- To copy an array, use a loop to copy its elements to a new array.
- When separating elements, don't place a separator before the first element.
- A linear search inspects elements in sequence until a match is found.
- Before inserting an element, move elements to the end of the array *starting with the last one*.
- Use a temporary variable when swapping two elements.

### Implement functions that process arrays.

- When passing an array to a function, also pass the size of the array.
- Array parameters are always reference parameters.
- A function's return type cannot be an array.
- When a function modifies the size of an array, it needs to tell its caller.
- A function that adds elements to an array needs to know its capacity.

C++ for Everyone by Cay Horstmann

## CHAPTER SUMMARY

### Be able to combine and adapt algorithms for solving a programming problem.

- By combining fundamental algorithms, you can solve complex programming tasks.
- You should be familiar with the implementation of fundamental algorithms so that you can adapt them.

### Discover algorithms by manipulating physical objects.

- Use a sequence of coins, playing cards, or toys to visualize an array of values.
- You can use paper clips as position markers or counters.

### Use two-dimensional arrays for data that is arranged in rows and columns.

- Use a two-dimensional array to store tabular data.
- Individual elements in a two-dimensional array are accessed by using two subscripts, `array[1][1]`.
- A two-dimensional array parameter must have a fixed number of columns.

*C++ for Everyone* by Cay Horstmann

## CHAPTER SUMMARY

### Use vectors for managing collections whose size can change.

- A vector stores a sequence of values whose size can change.
- Use the `size` member function to obtain the current size of a vector.
- Use the `push_back` member function to add more elements to a vector. Use `pop_back` to reduce the size.
- Vectors can occur as function arguments and return values.
- Use a reference parameter to modify the contents of a vector.
- A function can return a vector.
